                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  particularly members of tumour necrosis factor (TNF) family molecules designated as TREPA (TNF related endothelium proliferative agent). Soluble biologically active TREPA are used to treat TREPA-associated diseases, tumours or metastases. TREPA is used for inducing angiogenesis in human for promoting wound healing and for vascularising grafted tissue for successful grafting and to promote tissue grafts. The present amino acid sequence is human ULAfiag TREPA soluble construct. This sequence which is a biologically active molecule is capable of inducing proliferation in HUVEC (human umbilical vein endothelial cells) cells.
         The present invention relates to extracellular signal molecules, particularly members of tumour necrosis factor (TNF) family molecules designated as TREPA (TNF related endothelium proliferative agent). Soluble biologically active TREPA are used to treat TREPA-associated diseases, tumours or metastases. TREPA is used for inducing angiogenesis

humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Nov 20, 2001 this sequence version replaced gi:16605765.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were aither denthlesteration?
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em., EMBL; Sw:, courselves the sequence of the subcurrent of the su
                                                                                                                                                                                                                                                                                                                                                                                                             http://www.sanger.ac.uk/Projects/C_elegans/wormpep RP23-422L16 is from the RPCI-23 Mouse PAC Library constructed by the group of Pieter de Jong. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence

NOTE: Estimated insert size may differ from sequence length (see http://www.lbgsc.bcm.tmc.edu/docs/Genbank_draft_data.h NOTE: This is a 'vorking draft' sequence. It currently consists of 32 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequencing vector: Plasmid;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is that encoding human tumour necrosis factor related ligand (TRELL). TRELL or active fragments can be included with a carrier in pharmaceutical compositions to treat cancer, autoimmune diseases or immune responses to tissue grafts, or to stimulate or receptors, by labelling with a detectable label and screening compositions for binding. Agents interfering with TRELL-receptor binding can also be screened for, can then be administered, optionally with interferon- gamma, to induce cell death or treat, suppress or alter immune responses (especially involving human adenocarcinoma cells) involving a signal pathway between TRELL and its receptor. The DNA sequence can be used in gene therapy for TRELL-related disorders in mammals (especially humans), e.g. tumours, autoimmune and inflammatory diseases or inherited genetic disorders, by introducing into cells, and expressing, therapeutically effective amounts of a vector, e.g. a virus comprising a gene encoding TRELL. It may also be of use in the preparation of prepare probes for sorders in anterior therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      18-MAR-1997;

The polynucleotides can be used as probes for the CC identification and isolation of full length cDNA and genomic DNA. The CC polynucleotides and proteins can also be used as nutritional supplements. CC The proteins are useful in the treatment of various immune deficiencies CC and disorders such as viral infections, bacterial infections, fungal CC infections, autoimmune thyroiditis and diabetes) and allergic reactions CC conditions (e.g. asthma). They are also useful for treating CC neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's CC disease), liver fibrosis, coagulation disorders (e.g. haemophilia), CC inflammatory disorders (e.g. Crohn's disease) and tumours. They are also useful for treatment of burns, incisions and ulcers. The proteins are also useful for regulating CC haematopolesis and for treating myeloid or lymphold cell deficiencies. Sequences ABK34863-ABK35454 represent polynucleotides of the invention.

The present sequence encodes a human tumour necrosis factor (TNF) an Lymphotoxin homologue designated Apo-3 ligand. Apo-3 ligand has cytostatic activity. Apo-3 ligand can be used to induce apoptosis in mammalian cancer cells, to induce NF-kappaB-dependent transcription

                                 Alignment
                                               The present sequence is that of cDNA clone DNA30879-1152 CC (AFCC 209358) encoding human PRO207 (see AAY95338), which shows CC (homology to several members of the tumour necrosis factor family, CC especially human lymphotoxin (23.4%). The cDNA was identified in a CC feetal kidney cDNA library following identification of an expressed CC sequence tag with homology to human Apo-2 ligand. A claimed method CC for inhibiting the growth of a tumour cell comprises exposing the CC tumor cell to PRO179, PRO207, PRO320, PRO219, PRO221, PRO224, PRO328, PRO301, PRO526, PRO362, PRO356, PRO509 or PRO866 (see CC AAY95337-49), their agonists or chimeric polypeptides incorporating CC them. The tumour is especially a cancer selected from breast, CC ovarian, renal, colorectal, uterine, prostate, lung, bladder and CC central nervous system cancer, melanoma and leukaemia. Nucleic acids encoding PRO179 etc. are used in the recombinant production CC of the antitumour polypeptides.

                                                                                                                                                                The present invention relates to the isolation of novel human PRO polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polynucleotide sequences are also useful in gene therapy. ABR40254-ABR40288 encode for the human PRO polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Marsters

                                                                                                                                                                                                                                                                                                                                                                                                                         The TNF-related endothelium proliferative agent (TREPA), or its cactivators or agonists, are used to treat a deficit of TREPA, e.g. to promote wound healing or tissue grafting, by promoting vascularisation, calso to induce apoptosis for treating cancer and eliminating autoreactive Teells, as an adjunct to cancer chemotherapy or antiviral treatment. TREPA peptides can also be used to target cytotoxic agents or for caffinity isolation of the corresponding receptor, the nucleic acid for which can be used to transform tumour cells to render them more cresponsive to TREPA and to screen for TREPA mimics. Ribozymes, antisense RNA, antibodies or peptides, are used to treat TREPA-associated diseases, e.g. tumours and metastases (by inhibiting vascularisation), inflammation or a wide range of autoimmune conditions, conditions involving abnormal stimulation of epithelial cells (e.g. atherosclerosis), for birth control (inhibiting ovulation and placental contents).

Soluble biologically active TREPA are used to treat TREPA-associated diseases, tumours or metastases. TREPA is used for inducing angiogenesis in human for promoting wound healing and for vascularising grafted tissue for successful grafting and to promote tissue grafts. The present sequence is a cDNA clone ID #690050 encoding human TREPA.

the isolation of human TWEAK receptor (TWEAKR)-expressing clones from a COS cell human cDNA library. The TWEAKR protein is a member of the tumour necrosis factor (TNP) family and induces angiogenesis. TWEAKR may therefore be used to screen for and develop TWEAKR agonists and antagonists for the modulation of angiogenesis, to be used in the treatment and diagnosis of human disease. The disorders mediated by angiogenesis include ocular disorders characterised by ocular neovascularisation such as diabetic retinopathy, neovascular glaucoma, retinoblastoma, retinopathy of prematurity, retrolental fibroplasia, rubeosis, meaular degeneration and corneal graft neovascularisation, and inflammatory diseases such as arthritis, rheumatism and psoriasis. Other treatable diseases include malignant and the corneal diseases include malignant and content of the corneal diseases include malignant and the corneal diseases include malignant and diseases include malignan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TWEAK extracellular domain; tumour necrosis factor; TNF; angiogenesis; cocular necvascularisation; diabetic retinopathy; necvascular glaucoma; retinoblastoma; retinopathy of prematurity; retrolental fibroplasia; rubeosis; uveitls; macular degeneration; arthitis; rheumatism; ds; corneal graft neovascularisation; psoriasis; metastatic condition; malignant tumour; sarcoma; carcinoma; benign tumour; haemophilic joint; preneoplastic condition; myocardial angiogenesis; wound granulation; scleroderma; vascular adhesion; telangiectasia; ischaemia; human; atherosclerotic plaque neovascularisation; coronary atherosclerosis; pcc109-LZ-TWEAK; TWEAK receptor; TWEAKR;

APO4 is useful for diagnosing prostate cancer CC by determining levels of APO4 in an individual. Prostate cancer can also by determining levels of APO4 in an individual. Prostate cancer can also be treated using APO4 selective binding agents linked to a therapeutic CC moiety. APO4 polypeptides are also useful for identifying selective CC depends to the polypeptides are also useful for identifying selective CC expressed on the cell surface. The binding is preferably performed in CC expressed on the cell surface. The binding and observing the changer in APO4 CC expressed on the cell surface. The binding and observing the changer in APO4 CC activity. Effective pharmacological agents useful in diagnosis or CC treatment of disease are also identified using APO4 polypeptides/active fragments and APO4 signal transducer molecules that specifically interact CC with a cytoplasmic domain of APO4 and detecting a change in level of APO4 activity. The method is performed in vivo or in vitro. APO polypeptides are all useful as immunogens for preparing antibodies. APO4 is also CC useful for diagnosis/treatment of developmental or gestational CC abnormalities. APO8 was transfected to human breast carcinoma cell line MCF-7, and induced apoptosis.
